

BBVA

RESEARCH

3rd QUARTER
2016

Outlook
Colombia

Global

Global volatility

Volatility falls on more dovish central banks

Implicit volatility in equity markets

(Relative index)

Flight-to-quality pushes yields on government securities to historical lows

36% of sovereign bond yields in the developed world have negative rates

Volatility above its long-term average could stay until October (on emerging markets it will depend on commodities prices)

Global growth: ¿What is happening?

Central banks are facing a weak growth environment

USA and EZ GDP growth

(Annualized QoQ variation, %)

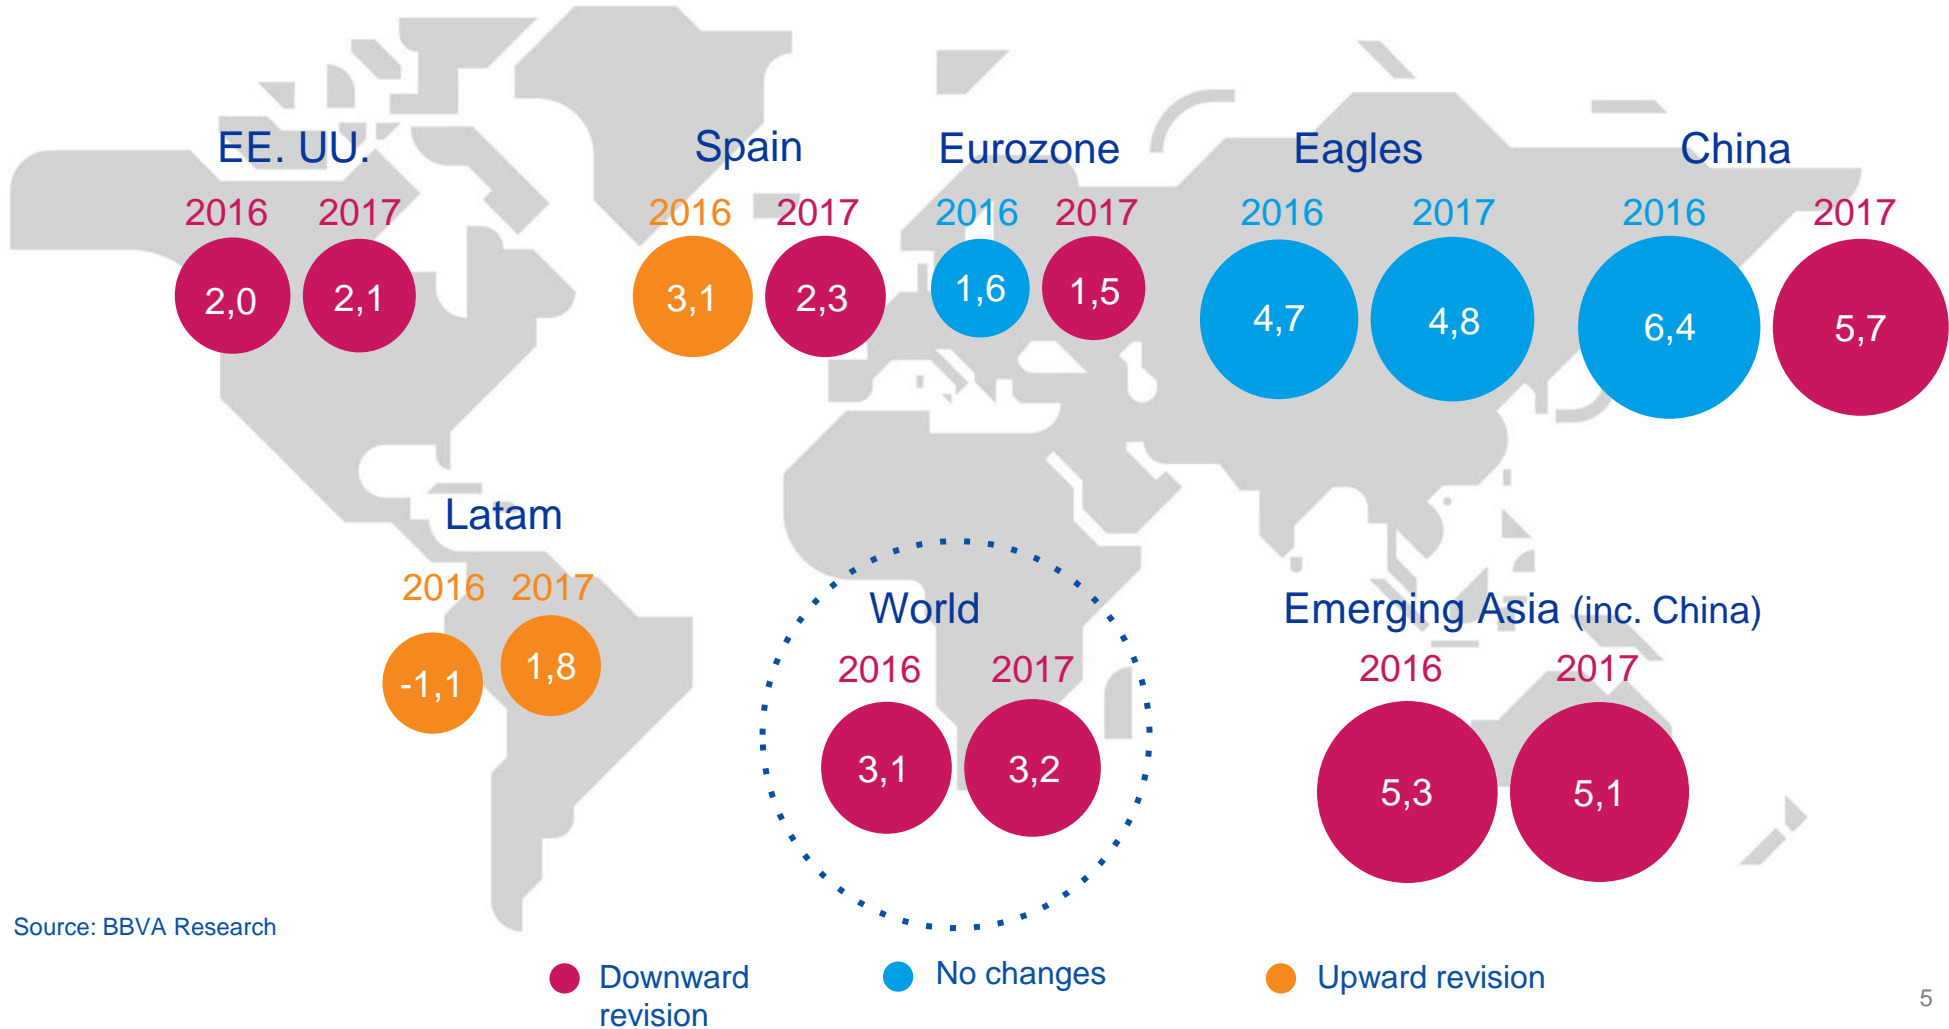

EZ decelerates and will grow at a slower rate due to Brexit.

Lackluster investment is dragging down GDP growth in USA...

...mainly in manufacturing and mining activities.

The world

Emerging economies lead global growth

Source: BBVA Research

A satellite night view of Colombia, showing the country's geographical features and city lights. The image is dominated by a dark blue and black color palette, with bright yellow and orange lights from cities and towns scattered across the landmass. The Andean mountain range is visible as a dark, textured strip running north-south through the center of the country. The surrounding oceans are dark, with some lights visible on distant islands and the South American continent to the west.

Colombia

Economic growth

Slowing consumption

Household consumption and retail sales

(YoY growth, %, *Up to May, 2016)

Determinants of slowing consumption:

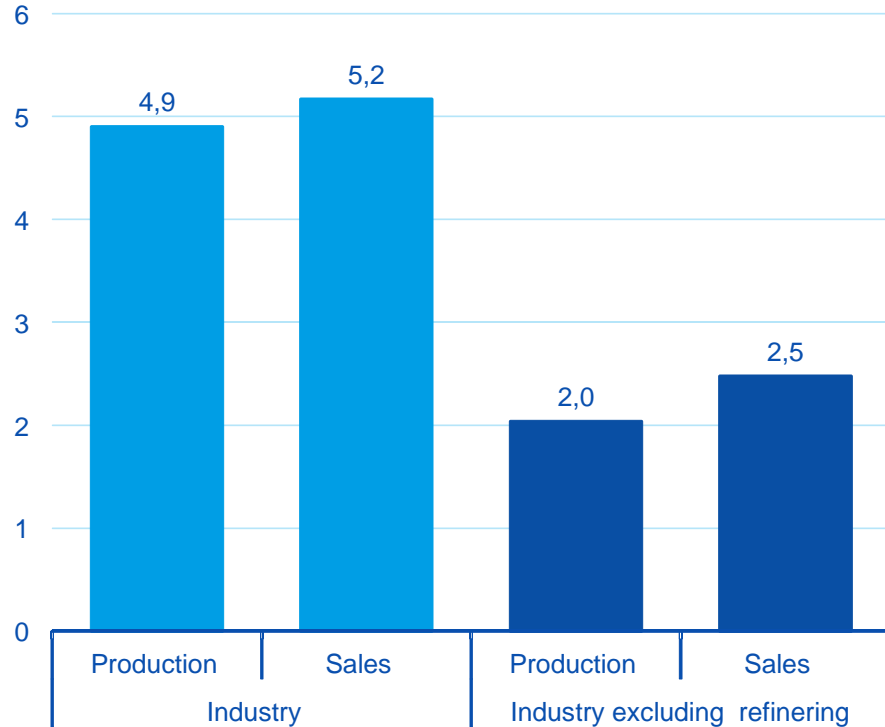

1. Low confidence. Anticipates weak durable-goods consumption
2. Interest rates. Rising headline inflation and its expectations
3. Terms of trade shock. Expenditure must adjust to the fall in the national income

Manufacturing

Recovering but with rising bottlenecks

Industry: production and sales

(Average growth, YoY between Oct-15 and May-16, %)

Capacity utilization nearing milestone. Investment rate is decreasing and the willingness to invest is low

GDP by demand side

Growth in 2017 will rely on investment

GDP by demand side (contributions)

(YoY, %, *Previsiones)

1. External demand. With positive contributions in 2016 on lower imports
2. Private demand. Main driver of the GDP growth in 2016 and 2017. Investment is a key driver in 2017.
3. Public demand. In 2016 is expected to low on weak expenditure by local governments.

GDP by demand side

Long run: Higher investment driven by 4G projects

Consumption and investment shares

(% of GDP, %, *Forecasts)

1. Higher household savings and lower leverage. Consumption growing at the pace of GDP growth.

2. Higher investment requires savings

3. Higher potential output. Higher investment will mitigate the slowing population growth

PIB by supply side

Even growth across sectors

GDP by supply side

(YoY, %, *Forecasts)

Leading sectors

- 1. Industry.** In 2016 y 2017 will grow above the GDP, even excluding oil refining
- 2. Construction.** In 2017 will be driven by low value housing projects and the 4G infrastructure program.
- 3. Agriculture.** Gaining momentum starting in 2017 on weaker currency and better weather conditions

Current account and FDI

Current account deficit begin its reversal

Current account and FDI
(USD billions)

In 1Q16, the current account deficit reached its lowest value since 4Q13 (in levels). However, as % of GDP the current account still was high (5,6%) and was fully financed by FDI.

Forecasts
(USD billions and % of GDP)

Current account deficit will remain above 5% of GDP in 2016 and 2017. FDI loses momentum but still will finance 62% del current account deficit in 2016-2018 (on average).

Central Government Balance

A faster adjustment it is required by the fiscal rule

Central Government Deficit

(% of GDP, as forecasted by the 2016 Fiscal Framework)

To comply with the fiscal rule, the Government plans to cut investment

If investment is cut, the economy growth would be weaker in the future

It is imperative to increase the tax revenue in 2017 and not adjust investment as the government says. Our scenario incorporates a tax reform

Inflation

Inflation won't reach 3% target until 2018

Inflation rate

(YoY, %, *Forecasts)

1. Private demand. Consumption is growing above GDP

2. Industry bottlenecks. Sales growing above production at the same time that investment is decreasing

3. Temporary variables. El Niño and truckers strikes

Exchange rate

Exchange rate volatility continues

Exchange rate volatility
(Standard deviation, 20-day window)

We expect a depreciation of 12,7% and a COP appreciation of 6,1% in 2016 and 2017

Exchange rate
(Monthly and annual average)

Lower current account deficit and higher oil prices explain the peso appreciation over the medium term

A hand holding a tablet computer against a blurred city skyline background. The image is dominated by blue tones, with a diagonal white line separating the top-left header area from the rest of the page. The word 'Conclusions' is written in a large, bold, blue font in the bottom right corner.

Conclusions

Colombia Outlook Takeaways

A gradual and well-ordered slowdown of the economy continues, reducing the macroeconomic imbalances

Macroeconomic vulnerabilities have diminished, though they have not disappeared

Market volatility in the wake of Brexit was offset by an expected more accommodating tone on the part of the Fed

A hand holding a tablet computer against a blurred city skyline background. The image is overlaid with a large, light blue diagonal shape that points towards the top right corner. The overall color palette is dominated by various shades of blue.

Thank you
