XXIV Symposium Moneda y Crédito, Madrid, November 4, 2011

Main results of the paper

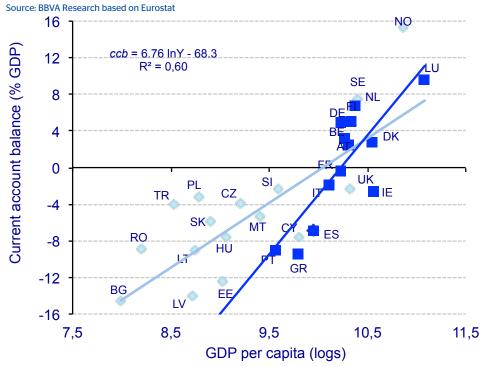

- **Pre-crisis period:** European institutions provided a solid protection against economic instability and shaped the incentives, expectations and actions of agents, eroding discipline at all levels.
- Whit the crisis markets changed dramatically their valuation of large imbalances
- The econometric analysis of the fundamentals of the risk premium corroborates the change of market perceptions
 - 1. Prior to the crisis only the **global turmoil indicator**, the level of GDP per capita and the rate of growth of GDP were statistically significant
 - During the crisis only the current account and the forecasted increase of public debt are significant
 - 3. The "halo effect" disappeared after the crisis and markets are now penalizing the previous deterioration of fundamentals.

Imbalances and the convergence hypothesis

- Before the crisis (excessive) current account imbalances were understood as the result of convergence hypothesis among EMU and EU.
- Consistent with economic theory (Barro, Mankiw and Sala-i-Martin, 1995): △ LTV

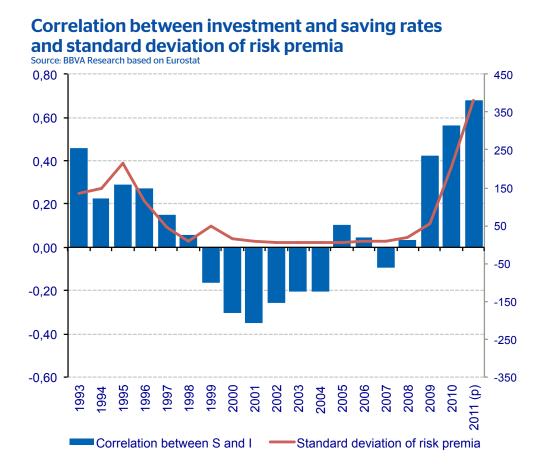

Imbalances and the convergence hypothesis

 From the mid 1900s to 2008 the Feldstein-Horioka puzzle vanished (Blanchard and Giavazzi, 2002), as well as the dispersion of risk premia (correlation equal to 0.8)

The crisis: the "halo effect" became negative

• With the current sovereign debt crisis euro area countries face higher risk premia than non euro countries with the same rating (Sanz, 2011)

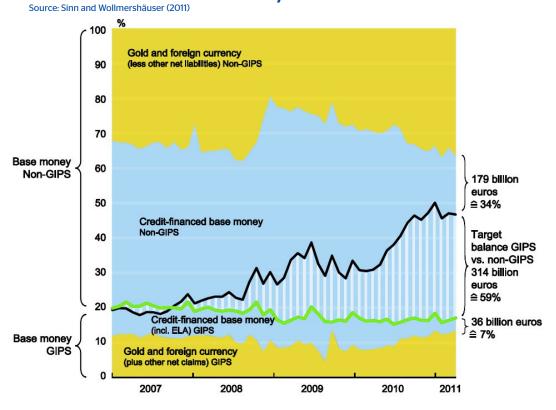

The crisis: distribution of monetary base

 Since financial markets are closed for some countries, they have increased their dependence on ECB liquidity.

Distribution of ECB's monetary base

EMU after the crisis

The need for institutional and structural reform to achieve economic convergence

- The new economic governance (SGP, Euro+ Pact) at the European level may prevent future crisis but cannot ensure economic convergence.
- EMU countries follow different growth models: coordinated market economies (Germany and other northern European countries) and the mixed market economies' of southern Europe (Greece, Portugal, Italy and Spain).
- To ensure economic convergence the institutions of mixed market economies should converge to the ones in coordinated market economies.

Varieties of Capitalism and Comparative Advantage (Hall and Soskice, 2001)

Liberal Market Economies (USA, UK)

Coordinated Market Economies (Germany, Northern Europe)

Mixed market economies (Southern Europe)

EMU after the crisis

The need for institutional and structural reform to achieve economic convergence

- Convergence hypothesis before the crisis: monetary and economic integration would be sufficient for economic convergence → growth → capital flows and reduced risk premiums
- With this crisis, the markets have concluded that this hypothesis was not correct: there are significant differences between European countries in their structural capacities, in fiscal policies and in institutions

Need for structural reform in developed countries

EMU after the crisis

The need for institutional and structural reform to achieve economic convergence

- Contrary to previous expansion years, during the crisis risk premium has been correlated with structural capacity (Cardoso and Doménech, 2010)
- This correlation will remain after the crisis (although with a much lower slope).

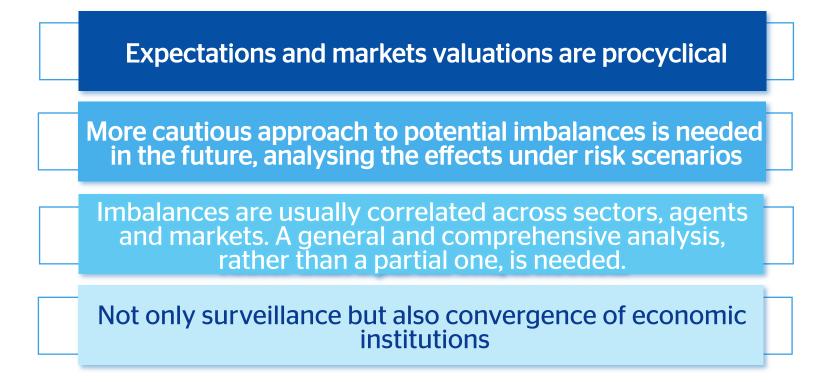

Structural capacity and country risk
